Security Audit Starter Report

Is your business as protected as you think?

The Reality

Most businesses don't discover they have a security problem until after a breach. By then, the damage — financial, operational, and reputational — is already done. This report gives you a high-level look at the areas where gaps most commonly exist, and what that means for a business like yours.

Where Businesses Are Most Exposed

Access & Identity	**Who has access to what — and should they?**	Overprivileged accounts and weak authentication are the most exploited entry points. Many businesses are exposed here without realizing it.
Network Perimeter	**What's visible to the outside world?**	Misconfigured services and unnecessary exposure create openings attackers actively scan for. A professional assessment reveals what you can't see from the inside.
Endpoint Security	**Are your devices actually protected?**	Traditional antivirus is no longer sufficient. Modern threats require modern detection — most SMBs have significant gaps in endpoint coverage.
Data Handling	**How is your sensitive data stored and moved?**	Unencrypted data, poorly configured cloud storage, and untested backups are common findings in nearly every assessment we conduct.
Incident Readiness	**What happens when something goes wrong?**	Most organizations have no tested plan. When a breach occurs, every hour without a response plan costs more in recovery time and damage.
Human Risk	**Are your people your weakest link?**	Social engineering and phishing remain the #1 attack vector. Without awareness and training, technical controls alone will not protect you.

What a Professional Assessment Uncovers

Professional security testing goes beyond checklists — it tests your actual systems, not your assumptions. In a typical engagement, our team uncovers:

Exploitable vulnerabilities — in internet-facing systems standard tools don't catch

Data exposure risks — in cloud storage, APIs, and internal file shares

Gaps between policy and reality — what you think is protected versus what actually is

Privilege escalation paths — that allow low-level access to become full system compromise

Authentication weaknesses — that bypass security controls entirely

The only way to know for certain is to test.

TrustWarden offers penetration testing and security assessments designed for startups and mid-size companies — no enterprise budget required. Book a free consultation and find out where you actually stand.
